

## **Effect of Integrated Nutrient Management on the Growth of Tuberose (*Polianthes tuberosa* L.) cv.**

**Rajat Rekha**

### **ABSTRACT**

The present experiment on effect of integrated nutrient management on the growth of Tuberose (*Polianthes tuberosa* L.) cv. Rajat Rekha was carried out during 2021-22 and 2022-23 at Horticulture Research Centre of Sardar Vallabhbhai Patel University of Agriculture & Technology, Meerut. The experiment consists of eighteen treatments which were replicated three times in Randomized completely block design. The results of investigation revealed that the treatment applied with 75% RDF + 2kg FYM/m<sup>2</sup> + 300g VC/m<sup>2</sup> + PSB + Azospirillum (T<sub>15</sub>) was found to be best in all the growth characters viz., days taken for spouting (12.10 & 14.18), plant height (40.8 & 41.7cm), length of leaves (48.0 & 48.6cm), width of leaves (1.78 & 1.80cm), and number of leaves (60.8 & 61.4).

**Keywords :** Tuberose, FYM, Vermicompost, PSB and Azospirillum.

### **Introduction**

Tuberose (*Polianthes tuberosa* L.) belongs to family Agavaceae and is native of Mexico. It is a one of the most important tropical bulbous flowering plants cultivated for production of long lasting flower spikes. It is popularly known as Rajanigandha. Commercial importance of tuberose is due to beauty of the flower, longer vase-life of spikes and aromatic oil extracted from its fragrant white flower and it has a great economic potential for cut flower trade and essential oil industry (Alan *et al.*, 2007).

It has great demand for home decoration, garland, flower decoration, bouquets and pots, in addition to the purpose of cutting flowers. Its essential oil is rich in geraniol, nerol, benzyl alcohol, eugenol, benzyl benzoate and methyl anthranilate and methyl salicylate (Hussain, 1986). Tuberose is a gross feeder and requires a large quantity of NPK, both in the form of organic and inorganic fertilizers (Amarjeet and Godara, 1998). INM helps in maintaining or enhancing soil productivity through a balanced use of fertilizers combined with organic and biological sources of plant nutrients, improving the stock of plant nutrients in

he soils and improve the efficiency of plant nutrients, thus, limiting losses to the environment. In the present investigations, studies have been made to know the effect of integrated nutrient management on the growth of Tuberose (*Polianthes tuberosa* L.) cv. Rajat Rekha.

## Material and Methods

The experiment was carried out at Horticulture Research Centre, Sardar Vallabhbhai Patel University of Agriculture & Technology, Meerut, Uttar Pradesh (India) during seasons of 2021-22 and 2022-23. The experiment was laid out in Randomized Block Design with eighteen treatments and three replications. Bulbs of tuberose cv. Rajat Rekha were planted in a spacing 30 cm × 30 cm. The different treatments were T<sub>1</sub> (control), T<sub>2</sub> (100% RDF), T<sub>3</sub> (50% RDF+ 2 kg FYM/m<sup>2</sup>+ PSB + Azospirillum), T<sub>4</sub> (50% RDF+ 1 kg FYM/m<sup>2</sup>+ PSB + Azospirillum), T<sub>5</sub> (50% RDF+ 300g VC/m<sup>2</sup>+ PSB + Azospirillum), T<sub>6</sub> (50% RDF+ 150g VC/m<sup>2</sup>+ PSB + Azospirillum), T<sub>7</sub> (50% RDF+ 2 kg FYM/m<sup>2</sup> + 300g VC/m<sup>2</sup>+ PSB + Azospirillum), T<sub>8</sub> (50% RDF+ 1 kg FYM/m<sup>2</sup> + 300g VC/m<sup>2</sup>+ PSB + Azospirillum), T<sub>9</sub> (50% RDF+ 2 kg FYM/m<sup>2</sup> + 150g VC/m<sup>2</sup>+ PSB + Azospirillum), T<sub>10</sub> (50% RDF+ 1 kg FYM/m<sup>2</sup> + 150g VC/m<sup>2</sup>+ PSB + Azospirillum), T<sub>11</sub> (75% RDF+ 2 kg FYM/m<sup>2</sup>+ PSB + Azospirillum), T<sub>12</sub> (75% RDF+ 1 kg FYM/m<sup>2</sup>+ PSB + Azospirillum), T<sub>13</sub> (75% RDF+ 300g VC/m<sup>2</sup>+ PSB + Azospirillum), T<sub>14</sub> (75% RDF+ 150g VC/m<sup>2</sup>+ PSB + Azospirillum), T<sub>15</sub> (75% RDF+ 2 kg FYM/m<sup>2</sup> + 300g VC/m<sup>2</sup>+ PSB + Azospirillum), T<sub>16</sub> (75% RDF+ 1 kg FYM/m<sup>2</sup> + 300g VC/m<sup>2</sup>+ PSB + Azospirillum), T<sub>17</sub> (75% RDF+ 2 kg FYM/m<sup>2</sup> + 150g VC/m<sup>2</sup>+ PSB + Azospirillum) and T<sub>18</sub> (75% RDF+ 1 kg FYM/m<sup>2</sup> + 150g VC/m<sup>2</sup>+ PSB + Azospirillum). Manures were applied and mixed into the soil thoroughly. The amount and type of manure applied was as per the treatments of respective plots. Cultural practices were kept uniform for all the treatments and standard practices were adopted to raise the crop successfully. Observation on growth attributes *i.e.* days taken for spouting, plant height (cm), length of leaves (cm), width of leaves (cm) and number of leaves per plant.

## Result and Discussion

The minimum days taken for spouting (12.10 & 14.18) was recorded in T<sub>15</sub> (75% RDF + 2kg FYM/m<sup>2</sup> + 300g VC/m<sup>2</sup> + PSB + Azospirillum) and found statistically at par with T<sub>16</sub> (14.21 & 15.25 days), T<sub>17</sub> (14.18 & 15.20 days) and T<sub>18</sub> (14.12 & 15.16 days). The earliest emergence of bulbs in Vermicompost + RDF might be due to the early absorption of N, P and K increased the availability of micronutrients as well as plant hormones due to which the time taken for emergence of bulbs was reduced significantly. Padaganure *et al.* (2005), Kabir *et al.* (2011) and Hadwani *et al.*, (2013) reported similar results in tuberose flowers.

The maximum plant height (40.8 & 41.7cm) was recorded in T<sub>15</sub> (75% RDF + 2kg FYM/m<sup>2</sup> + 300g VC/m<sup>2</sup> + PSB + Azospirillum), and found statistically at par with T<sub>11</sub> (38.2 & 39.5cm), T<sub>12</sub> (37.4 & 38.2cm), T<sub>13</sub> (39.0 & 39.8cm), T<sub>14</sub> (38.6 & 39.7cm), T<sub>16</sub> (40.2 & 41.4cm), T<sub>17</sub> (39.7 & 40.3cm) and T<sub>18</sub> (39.4 & 40.1cm). However, minimum plant height (28.4 & 30.6cm) was found in control. The result shows nitrogen and phosphorus had positive correlation with the plant height, it nutrient availability is increased with increase in organic sources viz. FYM, vermicompost and PSB. Nitrogen, a constituent of protein and is essential for formation of protoplasm, cell division and cell enlargement, while phosphorus a part of nucleic acids and also responsible for root development and the combined effect of higher availability of both nutrients in plant vicinity enhance the vegetative growth of the plant (Dahiya *et al.*, 2001, Yadav *et al.*, 2005 and Kumare *et al.*, 2014).

The maximum length of leaves (48.0 & 48.6cm) was recorded in T<sub>15</sub> (75% RDF + 2kg FYM/m<sup>2</sup> + 300g VC/m<sup>2</sup> + PSB + Azospirillum) and found statistically at par with T<sub>11</sub> (44.7 & 45.1cm), T<sub>12</sub> (43.8 & 44.3cm), T<sub>13</sub> (45.5 & 45.9cm), T<sub>14</sub> (44.8 & 45.4cm), T<sub>16</sub> (46.8 & 47.3cm), T<sub>17</sub> (45.7 & 46.4cm) and T<sub>18</sub> (45.7 & 46.1cm). However, minimum length of leaves (37.2 & 37.8cm) was found in control. The results revealed that length of leaves were greater with organic fertilizer application along with chemical fertilizers. These results indicate that application of organic fertilizers had tremendous effects on plant growth and development in tuberose. Further the effect was more pronounced in FYM + vermicompost + PSB combination followed by FYM + PSB combination. These results have conformity with the result of Padaganure *et al.* (2010) who

reported that application of organic fertilizers along with chemical fertilizers enhanced plant growth and development in tuberose. Similar findings were reported by Desai and Thirumala (2015).

The maximum width of leaves (1.78 & 1.80cm) was recorded in T<sub>15</sub> (75% RDF + 2kg FYM/m<sup>2</sup> + 300g VC/m<sup>2</sup> + PSB + Azospirillum) and found statistically at par with T<sub>11</sub> (1.70 & 1.72cm), T<sub>12</sub> (1.68 & 1.72cm), T<sub>13</sub> (1.72 & 1.75cm), T<sub>14</sub> (1.71 & 1.73cm), T<sub>16</sub> (1.76 & 1.78cm), T<sub>17</sub> (1.75 & 1.77cm) and T<sub>18</sub> (1.74 & 1.76cm). However, minimum width of leaves (1.48 & 1.50cm) was found in control. The results indicated that essentiality of nitrogenous element in organic form enhanced to constitute chlorophyll which leads to better leaves over control treatment. Kadu *et al.* (2009) reported that the profound effect of nitrogen fertilization on anatomical structure of tuberose. Similar results were also reported by Meena *et al.*, (2015).

The maximum number of leaves (60.8 & 61.4cm) was recorded in T<sub>15</sub> (75% RDF + 2kg FYM/m<sup>2</sup> + 300g VC/m<sup>2</sup> + PSB + Azospirillum) and found statistically at par with T<sub>16</sub> (58.3 & 60.3cm), T<sub>17</sub> (56.9 & 57.4cm) and T<sub>18</sub> (56.2 & 56.8cm). However, minimum number of leaves (32.1 & 34.6cm) was found in control. Kabir *et al* (2011) also noted that the number of leaves was significantly increased with the application of half of chemical fertilizer along with vermicompost in tuberose. These findings are in agreement with Pradhan *et al.*, (2017).

## **Conclusion**

On the basis of finding of two consecutive years of experiments, it can be concluded that treatment T<sub>15</sub> (75% RDF + 2 kg FYM/m<sup>2</sup> + 300g VC/m<sup>2</sup> + PSB + Azospirillum) may be recommended to farmers of Meerut district, Uttar Pradesh for better growth of tuberose.
