

Editor's Comment:

The direction of research chosen is relevant. In the manuscript, the authors examine the therapeutic potential of oral administration of an aqueous extract of *Garcinia kola* seeds for experimental acetic acid-induced colitis in Wistar rats.

The research was carried out at a high scientific and methodological level.

The purpose and objectives of the research have been fully completed.

The authors do not allow incorrect citation of literature. Modern methods and equipment were used to carry out the research. The resulting material was processed statistically.

The conclusion is consistent with the results obtained and the conclusions drawn.

However, the following observations can be made.

1. The work structure does not meet the requirements. Structure: introduction, materials and research methods, results, discussion, conclusion, bibliography. Remove unnecessary items.
2. Abstract. Edit the purpose of the study. The purpose of the research should usually be one sentence.
3. Introduction. Add a research goal.
4. Clause 1.4. Add the weight and age of the rats.
5. The method does not include statistical data processing.
6. Results. Simply showing research results is not enough. They must be accompanied by text! Correcting these comments will improve the quality of the manuscript and increase interest in the publication. Thus, I recommend accepting the manuscript after eliminating the comments.
