

**Editor's Comment:**

The manuscript should be considered for publication pending the following correction.

The manuscript can be published in your journal with minor revision.

1-The author must add the HPLC chromatogram of the isolated sample and that of the authentic carnosic acid.

2- The calibration curve of carnosic acid also is to be add.

3- I think that Column purification of the isolated carnosic acid is required.

This study presents a valuable exploration of supercritical CO<sub>2</sub> extraction for carnosic acid from rosemary, demonstrating the method's potential for sustainable practices.

However, the relatively low purity of the final product suggests that further optimization of the extraction and purification processes is essential for enhancing commercial viability.
