

**Editor's Comment:**

The manuscript studies the association between Ava II polymorphism in the LDL receptor gene and hyperlipidemic patients with ischemic stroke.

The research was conducted at a high scientific and methodological level.

The purpose and objectives of the research were fully accomplished.

The authors used modern methods and equipment.

The authors do not allow citing literary sources without appropriate indication.

The conclusion corresponds to the results obtained.

The text of the manuscript is written in an understandable language. It is well structured.

However, the following comments should be made.

1. Introduction. There is no purpose of the study.
2. Table 2. There are no units of measurement for some indicators.
3. Literature. Very old literature. Only 2 sources from 2021. There are no newer ones. The rest are very old. It is necessary to update newer sources.

Elimination of comments will improve the quality of the manuscript and interest in it from readers.

I recommend accepting after correcting the comments.
