

Editor's Comment:

The manuscript examined the association between the Ava II polymorphism in the LDL receptor gene and hyperlipidemic patients with ischemic stroke.

The research was carried out at a high scientific and methodological level.

The purpose and objectives of the research were completed in full.

The authors used modern methods and equipment.

The authors do not allow citing literary sources without appropriate indication.

The conclusion is consistent with the results obtained.

The text of the manuscript is written in clear language. Well structured.

However, the following remarks should be made.

1. Introduction. There is no research purpose.
2. Methodology. There are no patient inclusion criteria. What indicators were taken into account when selecting patients.

I recommend accepting the manuscript after correcting the comments.
