

Editor's Comment:

The study focuses primarily on the sustainable food waste management of smart packaging . Therefore, first of all, the dimensions of food loss and waste in the world should be conveyed based on UN FAO and other relevant sources to underline the importance of the subject. Among these, the role and importance of the losses originating from packaging should be emphasized. In particular, the environmental impacts of incorrect packaging, such as microplastics, should be underlined.

- While the study includes a lot of information about general packaging, not enough information is provided about smart packaging systems and management, which constitute the main subject of the manuscript.
- The review-manuscript mainly focuses on some fresh products, but perishable food varieties such as meat, dairy, fishery and egg products are not mentioned much, which is a significant omission.
- The summary should also cover these aspects.
- Unfortunately exactly same sentences have been repeated in many parts of the manuscript i.e under the subsections of "Role of packaging.." and "Importance of packaging..". Spelling and expression errors should be corrected. It should be explained whether Figure 1 was developed by the authors or taken from a literature source. References published recently on the similar subject should be added. The correct source should be used for UN sustainable development goals and given in the list of references.

The article should be revised taking all these issues into consideration.
