

Editor's Comment:

In the manuscript, the authors studied the Effect of diphenyl diselenide on acute impairment of antioxidant defense caused by ethanol and expression of inflammatory genes in rats.

The purpose and objectives of the study have been fully accomplished.

The studies were conducted at a high scientific and methodological level.

The authors used modern equipment and research methods.

The obtained material has been statistically processed.

The authors do not allow the use of literary data without citing it.

The conclusion is consistent with the results obtained.

However, the following comments can be made.

1. Results. Including tables and figures with research data is not enough. Some description of them is necessary.

2. Discussion. There is no analysis of the obtained results.

3. Conclusion. There is no assessment of the obtained data.

Correction of comments will improve the quality of the manuscript and interest in it among readers.

I recommend revising the manuscript.
