

### **Editor's Comment:**

Regarding the manuscript paper "Geospatial Interpolation of Gold Anomalies : Kriging Verse Inverse Distance Weight"

The paper is interesting, **it can be published** but by completing it with some modifications following the remarks made by the reviewers, which I find important and necessary for a better quality of publication :

- 1) Add the study area to the topic : Geospatial Interpolation of Gold Anomalies in the Wassa-Amenfi District of Ghana : Kriging Verse Inverse Distance Weight)
- 2) The map of the study area is poorly presented. Map needs to be adjusted
- 3) Take few samples within the areas predicted by the kriging and IDW methods and plot them on the produced map to verify the accuracy of their predictions. In this case, you must also present the table of sample's results
- 4) Explain why one method is better than the other using the results of your study as well as the different mathematical equations behind the two methods.
- 5) There is no comparison of your results with similar works done in the study area or elsewhere.
- 6) Need to check the format and cross references from the list given. The format to be standardize and check carefully.
