

Editor's Comment:

Concerning the editorial decision for manuscript number :2021/EJNFS/79771, I could request a change before publication.

The use of superscripts that was removed was important since it gave information on the effect of storage condition on the parameters measured. The LSD values used may be indicating the differences in parameters between the honey types.

The manuscript is reporting on effects of floral origin (types of honey) and storage period (not conditions as the title suggests) and therefore the data should indicate this, by use of superscripts across the row for storage period and down the column for types of honey.

After this simple correction, then the manuscript can be published.
