PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments	<ul style="list-style-type: none"> - Authors need to provide a FISH-picture of a metaphase; for this also FISH can be done on already GTG-stained metaphases. It is essential to see where bcr-abl-fusion happened. At least they need to provide a scheme to show what they suggest to have happened. - ISCN(2020) must be cited and used to create a correct karyotype formula 	
Minor REVISION comments	<ul style="list-style-type: none"> - In most similar cases the complex rearrangement did not impair the treatability of CML by Imatinib. Obviously no follow-up of the patient under this kind of treatment was done yet. So either now first effects of Imatinib can be seen and reported or at least the normally good response of similar cases should be mentioned. 	
Optional/General comments		

PART 2:

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Are there ethical issues in this manuscript?	<i>(If yes, Kindly please write down the ethical issues here in details)</i>
