PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments		
Minor REVISION comments		
Optional/General comments	<p>The lack of therapeutic adherence is a problem of great impact worldwide, predominating above all in patients with chronic diseases, in which long-term adherence comprises little more than 50%, but is lower in developing countries. As a consequence, we have higher hospitalization rates, increased health costs and therapeutic failures, among other problems. According to the World Health Organization (WHO), there are five factors that intervene in therapeutic adherence: 1: socioeconomic, 2: treatment-related, 3: patient-related, 4: disease-related and 5: disease-related. the health team.</p> <p>When there is therapeutic failure, the lack of adherence to treatment must always be considered before resorting to the intensification of alternative treatments or unnecessary tests that may put the patient at risk.</p> <p>Improving adherence has the potential to dramatically reduce costs and significantly improve the clinical condition of patients.</p> <p>I have missed assessing the combination of drugs in a single pill as a strategy to improve adherence and clinical proposals that can be established in the light of the data presented by the authors. Even so, it seems to me to be a good study, necessary, since analysing the causes of the lack of adherence is the first step to face this serious problem.</p>
